## 4. Chapter: Psychology MCQ 2009 Final Exam

### 1. Psychology MCQ 2009 Final Exam Questions

#### 4.1.1. What Piagetian developmental gain in thinking has been associated s...

Author: John Gabrieli

What Piagetian developmental gain in thinking has been associated specifically

with increased blood flow to the frontal lobes?

Please choose only one answer:

- egocentric perspective
- conservation of mass
- theory of mind
- object permanence

Check the answer of this question online at QuizOver.com:

Question: [What Piagetian developmental gain in thinking by Prof. John Gabrieli](#)

#### 4.1.2. In one study (from Woodward, 1998), 3-month olds and 6-month olds r...

Author: John Gabrieli

In one study (from Woodward, 1998), 3-month olds and 6-month olds repeatedly saw a person reach for an object (ball) on the left and not reach for a teddy bear on the right. Then, they saw a display in which the teddy bear was on the left, and the ball on the right. The person either reached for the teddy bear on the left (same action, new object) or the ball on the right (same object, new action).

Looking time was used as a measure to infer how the 3-month olds and 6-month olds interpreted the relation between the initial habituation phase and the subsequent changed test phases. The results indicated

Please choose only one answer:

- both 3-month olds and 6-month olds looked longer when the person grabbed a new object than when the person made a new action
- both 3-month olds and 6-month olds looked longer when the person made a new action than when the person grabbed a new object
- 3-month olds looked longer when the person made a new action, but 6-month olds looked longer when the person grabbed a new object
- 6-month olds looked longer when the person made a new action, but 3-month olds looked longer when the person grabbed a new object

Author: John Gabrieli

Adult development can be studied cross-sectionally or longitudinally. All of the

following are true for cross-sectional designs relative to longitudinal designs

EXCEPT for which answer?

Please choose only one answer:

- Cross-sectional designs take less time to accomplish
- Cross-sectional designs are less likely to be confounded by practice effects
- Cross-sectional designs are less likely to be confounded by cohort effects
- Cross-sectional designs are less likely to be confounded by selective attrition

#### 4.1.29. Which of these is TRUE of social support?

Author: John Gabrieli

Which of these is TRUE of social support?

Please choose only one answer:

- Social support affects the emotional response to stress but has no effect on health or longevity.
- Perceived social support is more important than the actual size of one's social network.
- Enacted social support (such as bringing dinner to a friend who is busy studying for exams) is most important in decreasing stress.
- Enacted social support always decreases stress, even if the support comes from a person with whom you have a negative relationship.
